### Fabric Hackathon Introduction

Welcome to today's Fabric Hackathon! Our mission is to build a simple but powerful **analytics platform** using Fabric. Throughout the day, you'll bring in data from multiple sources, transform it for analytical use, experiment with AI to enhance your workflows, and finally surface everything in a report or dashboard.

 **Don't Panic!**—this is a hands-on, guided experience

We'll walk you through each part step-by-step, and there's no expectation that you finish every section right on time. You'll have the full day to work through everything at your own pace.

Each section is designed to take about **two hours**, and we'll pause at the end of each one to share learnings and talk about the different paths participants took. If you're still working, that's totally fine—keep going!

Our coaches will be moving around the room all day. **If you get stuck, raise your hand or wave someone down—we're here to help.**

### Success Criteria

1. **Connect sources** to ingest and transform data for analytics.
2. **Use Copilot.** That's it. Use it to build your pipeline, suggest KPIs, help explore your data, or all of the above. Show us how Copilot helped you get insights.
3. **Use AI to discover insights.** This can be anomaly detection, sentiment analysis, or any AI feature *other than Copilot*. We want to see your creativity with AI inside Fabric.
4. **Build a report.** It doesn't have to be fancy—just focus on how you want to display and communicate your data.
